

Agentic Engineering in Practice

You own your code.

Nothing changes that.

But the way we work is
changing.

You own your code.

You need to own your
workflow, too.

This half day workshop is structured as a series of 5 modules:

Module 0 (Optional):
Get to Know Your
Agentic Tool

*Hands-on activity: Using your
Agent and Mode Switching*

Module 3:
Implementation

*Hands-on activity: Spec-Driven
Execution*

Module 1:
Requirements Gathering

*Hands-on activity A: Design
Thinking for Software
Requirements*

*Hands-on activity B: Using an
Agent to Understand your
Codebase*

Module 4: Verification

*Hands-on activity: Review &
Risk Decision*

Module 2: Spec Creation

*Hands on activity: Creating a
high-quality spec*

Module 0: Get to Know Your Agentic Tool

Meet Bob.

Core functionality and features:		Custom instructions and system prompts	Tool use & MCP servers
Context	Memory	Execution environments	Permissions

The Wall 

The solution?

Alignment.

PROJECT TRUST: The trustworthiness of the project being worked on

HUMAN OWNERSHIP: Your ability to control the state of the project

AGENT AUTONOMY: The agent's ability to make independent progress

Spec Driven Development:
Maximize **autonomy** without sacrificing **trust** and **ownership**

Module 1: Requirements Gathering

Your requirements! ↪

Real world problems are messy.

Bob is here to guide you.

Validation Criteria

This is the **ownership** phase.

Introducing Your Codebase

Activity: Design Thinking for Software Requirements

Activity: Using an Agent to Understand your Codebase

Module 2: Spec Creation

The Initial Prompt

Reviewing and Refining

Agent **autonomy** increases,
but **you** remain the decision
maker

Activity: Creating a high-quality spec

Module 3: Implementation

Supervision is a balancing act

Consider the Ralph Loop:

- **Read** the spec and current state.
- **Select** the next highest-priority task.
- **Implement** the task.
- Run **tests, linting, or validation**.
- **Record** progress.
- **Restart** with fresh context.
- **Repeat** until all tasks are complete.

Restarts are part of the process

This is where **agent autonomy**
takes the stage

Activity: Spec-Driven Execution

Module 4: Verification

Common failure modes

Structural
Content
Stylistic

Review — human or AI?

The goal at this phase is to have a **synergistic** approach.

Ensure the **trust** of your project, while still maintaining a level of **agent autonomy**.

Activity: Review & Risk Decision
